

## Q

**What pH value or below is considered high acid and safe for canning without pressure?**

## ANSWER

**4.6 or below**

## FUN FACT

*High-acid foods like most fruits and pickles prevent dangerous bacteria from growing!*

Source: SP 50-1000 Turkey basics

## Q

**Why must low-acid foods be canned using a pressure canner instead of just a boiling water bath?**

## ANSWER

**Because Clostridium botulinum bacteria can grow and produce deadly toxins if not heated enough**

## FUN FACT

*Botulism bacteria thrive in low-acid canned foods if not processed properly.*

## Q

**What minimum internal temperature should cooked eggs reach to be safe from Salmonella?**

# FOOD SAFETY

Teens (14–18)

## ANSWER

**160°F (when yolk and white are firm)**

## FUN FACT

*Using a food thermometer can help you cook eggs safely every time!*

Source: PNW 720 Proper egg handling

## Q

**How soon should cooked egg dishes be refrigerated to keep them safe?**

## ANSWER

**Within 2 hours of cooking**

## FUN FACT

*Cooling food quickly helps stop dangerous bacteria from growing.*

Source: PNW 720 Proper egg handling

## Q

**What is one reason fresh fruits can be preserved safely by canning without pressure?**

## ANSWER

**They naturally have high acid (pH 4.6 or below)**

## FUN FACT

*Acidic foods stop harmful bacteria from growing during home canning.*

Source: SP 50-1000 Turkey basics

## Q

**Why is it important to keep raw eggs separate from ready-to-eat foods during preparation?**

## ANSWER

**Eggshells can carry  
Salmonella bacteria that can  
contaminate other foods**

## FUN FACT

*Cross-contamination is a common way foodborne illness spreads in the kitchen.*

Source: PNW 720 Proper egg handling

## Q

**What is the 'danger zone' temperature range where bacteria grow fastest in food?**

# FOOD SAFETY

Teens (14–18)

## ANSWER

**40°F to 140°F**

## FUN FACT

*Keeping food out of the danger zone helps stop bacteria from multiplying.*

Source: SP 50-1000 Turkey basics

**Q**

**What preservation method works by stopping enzyme action that causes fruits and vegetables to spoil?**

## ANSWER

**Heating such as blanching or canning**

## FUN FACT

*Heat stops enzymes so your canned veggies keep their color and flavor longer.*

Source: SP 50-1000 Turkey basics

## Q

**Why must herbs and vegetables stored in oil be refrigerated or frozen if made at home?**

## ANSWER

**Because low-acid oil mixtures can allow botulism bacteria to grow at room temperature**

## FUN FACT

*Commercial garlic-in-oil mixes are acidified so they can be stored safely at room temperature.*

Source: SP 50-1000 Turkey basics

## Q

**Which of these practices helps prevent foodborne illness when handling raw poultry or meat?**

## ANSWER

**Washing hands, knives, and surfaces with hot soapy water after contact**

## FUN FACT

*Washing your hands and surfaces cuts down the spread of harmful bacteria.*

Source: PNW 250 You can prevent food borne illness

## Q

**What does the term 'pasteurization' mean in home food safety?**

## ANSWER

**Heating to a temperature that kills harmful microbes without cooking the food**

## FUN FACT

*Pasteurization makes raw milk and eggs safer without changing taste much.*

Source: SP 50-1000 Turkey basics

## Q

**How does freezing help preserve food safety?**

## ANSWER

**By stopping bacteria growth through very low temperatures**

## FUN FACT

*Freezing keeps food safe almost indefinitely if kept at 0°F or below.*

Source: SP 50-1000 Turkey basics

## Q

**Why should preserved foods be used within recommended dates or storage times?**

## ANSWER

**Because safety and quality decline after the recommended storage time**

## FUN FACT

*Even canned and frozen foods can spoil or lose safety over time.*

Source: SP 50-1000 Turkey basics

## Q

**What is a sign that low-acid canned food may be unsafe to eat due to bacteria?**

## ANSWER

**Can is bulging, leaking, or smells bad**

## FUN FACT

*Never taste home-canned food from bulging or damaged cans-it could cause botulism.*

Source: SP 50-1000 Turkey basics

## Q

**What is a safe way to thaw frozen meat to avoid bacterial growth?**

## ANSWER

**In the refrigerator, not at room temperature**

## FUN FACT

*Thawing in the fridge keeps meat at a safe, cold temperature.*

Source: SP 50-1000 Turkey basics

## Q

**Why is it unsafe to store eggs at room temperature for long periods?**

## ANSWER

**Because Salmonella bacteria can grow if eggs are not kept cold**

## FUN FACT

*Always keep eggs refrigerated to slow harmful bacteria growth.*

Source: PNW 720 Proper egg handling

## Q

**Which condition is NOT favorable for *Clostridium botulinum* to grow in food?**

## ANSWER

**High acidity (pH below 4.6)**

## FUN FACT

*Botulism spores cannot grow in acidic foods like pickles and most fruits.*

Source: SP 50-1000 Turkey basics

## Q

**Why is keeping cooked foods at or above 140°F important for safety?**

# FOOD SAFETY

Teens (14–18)

## ANSWER

**Because it slows or stops growth of harmful bacteria**

## FUN FACT

*Hot holding food prevents bacteria from multiplying and causing illness.*

Source: PNW 250 You can prevent food borne illness

## Q

**What is the role of blanching vegetables before freezing?**

## ANSWER

**To stop enzymes that cause spoilage and maintain quality**

## FUN FACT

*Blanching veggies preserves their color, texture, and nutrition in the freezer.*

Source: SP 50-1000 Turkey basics

## Q

**Which of these is NOT a safe way to handle raw eggs in recipes calling for them uncooked?**

## ANSWER

**Use unpasteurized raw eggs straight from the shell**

## FUN FACT

*Pasteurized eggs reduce the risk of Salmonella when using raw eggs in dishes.*
